

# GRIEF REACTIONS

## Coronavirus (COVID-19) pandemic

Everyone responds to loss in their own way. These are all normal reactions. Feelings may come and go and vary in intensity as we learn to live with a loss.

**Shock, numbness, disbelief:** This is unreal, a nightmare – how could this have happened? Numbness and denial buy us time to assemble the support and strength we'll need to face the feelings and process what this loss is going to mean.

**Sadness:** Loss can bring deep sorrow, emptiness, and despair. It hurts. Expressing this sadness, by crying, talking or some other way, can help to release some of the pain we carry.

**Anxiety and fear** can well up. Worries about the future and our own mortality can be triggered. While stressful, feelings of anxiety and vulnerability can help us turn to others for support.

**Guilt and regret:** We can second-guess our actions, thinking we could have done something to prevent the death or brought more comfort in some way. There may be regrets about last interactions. We may even feel guilty for being healthy when someone we care about dies. These emotions highlight the loss of control we feel when death strikes, but they can also propel us to find a meaningful way to respond to the loss.

**Anger/blame:** A profound loss can upend our sense of universal fairness – this isn't right. Anger may be directed at the circumstances we're in, at ourselves, or others for not preventing the death. Our deepest beliefs can come into question. Anger can be a response to helplessness and lack of control.

**Acceptance** doesn't mean moving on. It means we've come to terms with the loss. We've figured out where the memory of the person and the past fits now. By integrating the loss into who we are, we're able to begin considering the future.

Intense or prolonged grief reactions can lead to thoughts of suicide. If you or someone you know is thinking about suicide, get help immediately. **Call 911 or National Suicide Prevention Lifeline 1-800-273-8255 (TALK).**
